

Fabricated Fittings: BEVELS/ END CAPS/ TEES

DESCRIPTION

Shur-Fit Products' Fabricated Fittings are manufactured from either:

- .020" thickness, premium grade 3003 series aluminum. They are available in smooth or stucco embossed finish, tedlar coated and painted aluminum.
- .016" thickness, T304 stainless steel in a smooth or stucco embossed finish.

Fittings have a factory applied PolySurlyn™ moisture barrier and are available from 2 7/8" OD to your largest size required. The End Caps and Bevels are manufactured with a pittsburgh collar, and the Tees with a flare lock.

APPLICATIONS

Used on mechanical pipe systems such as cold storage facilities, food processing and industrial plants:

- Bevels are used to transition from one OD size to another.
- End Caps are used at termination points to protect the insulation and vapor barrier.

ADVANTAGES

Shur-Fit Products' Fabricated Fittings are the best solution in vertical piping systems because the flat collar is able to sit tight to the metal jacket underneath, ensuring a watershed in the jacketing system.

They are manufactured from the same material as the straight jacket (*3003 series aluminum or T304 stainless steel*), which resists damage much more than soft metals used for deep drawing such as pressed elbows. This material allows the product to blend into the system and provide a professional finish. The PolySurlyn™ multilayered moisture barrier provides resistance against corrosion.
